FRAMES n=4: status check

14 October 2026 | Elite local CPU | No Ruche contact

Unchanged since the completed 12 October runs.

No active local FRAMES runner matched the host process check.
No newer files were found in the four local FRAMES campaign roots.
The longer precision phase was proposed; it has not been launched.

Best measured calibration endpoints

Channel	RMSE	Fidelity	TP residual
0	1.688e-06	0.9999999936	5.036e-05
1	1.795e-06	0.9999999970	5.368e-05

Fidelity and TP pass. RMSE remains 1.69–1.80 times above its limit.

Unchanged gates: fidelity ≥ 0.99; RMSE ≤ 10^{-6}; normalized TP ≤ 10^{-3}.

What is complete

12-setting screen across penalty, step/momentum schedules and batch size;
two long-budget finalists; then one separately declared late-step follow-up.
33 archived runs including 3 resource pilots; no numerical failures.
Independent audits and exact 48k-prefix checks passed.
Confirmation was skipped because neither calibration channel passed
the joint gate. Prior results and final held-out channels remain preserved.

Next step — pending, not running

Test a longer precision phase with the current configuration fixed.
Only after both calibration channels pass: run fresh-channel confirmation.
This remains noiseless rank-one n=4 calibration, not a completed
best-for-best comparison with Quiroga or a higher-qubit result.

Latest completed experiment: 12 October 2026, 20:45 Europe/Paris.
Full loss plots: QPT_FRAMES_N4_POLISH_20261012.pdf.
No experiment was launched by this status check.
