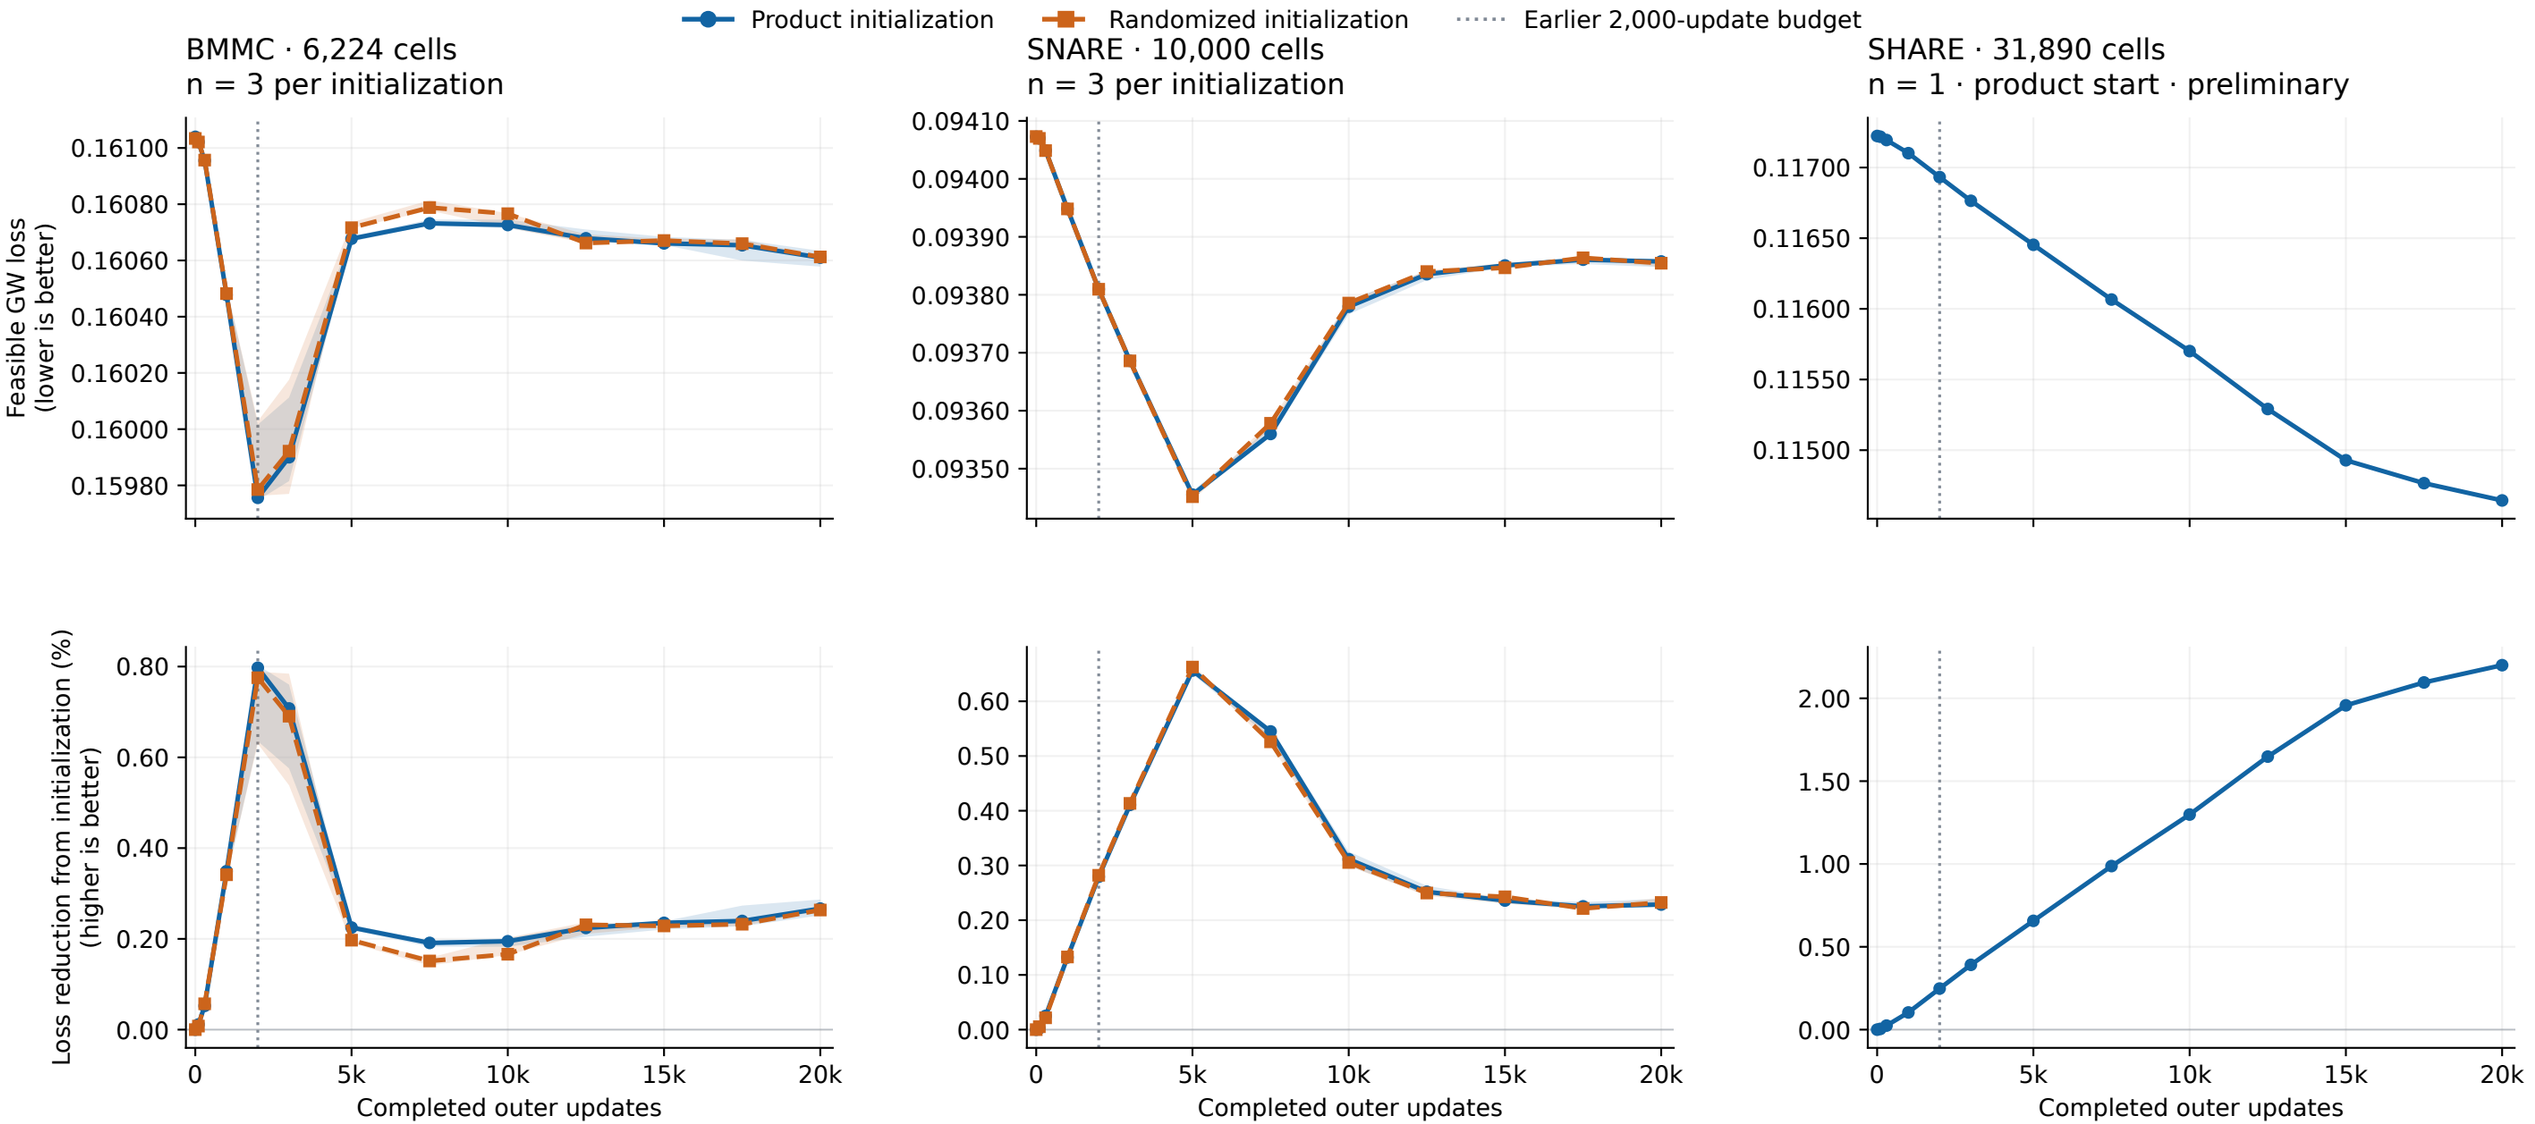
FraMES: loss over 20,000 updates

BMMC and SNARE: three-seed medians and interquartile bands | SHARE: one completed run



Markers show saved current-iterate losses. Lines connect observations; shaded bands are IQRs, not confidence intervals.

Percentage reduction is computed per seed before aggregation; it is not an optimality gap. Axis scales differ by dataset.

Loss: unregularized squared GW objective of the rounded feasible plan. Intermediate diagnostics: FP32; final endpoints: FP64.

Snapshot: 8 October 2026, 10:30 Paris. SHARE randomized initialization and remaining seeds are still pending.
