# Quiroga–FRAMES status

5 October 2026, 11:39 CEST | Elite, GitHub and Ruche

**The corrected comparison is ready locally. Its Ruche experiment has not started.**

No new calibration or held-out results are available. The last completed work was the implementation, review and tiny local smoke on 4 October.

Source: Elite is clean at 0586c15. The live GitHub branch remains at d62fcf1; two local commits are unpublished. The corrected source and campaign staging directories are absent on Ruche.

Validation: the last recorded full suite had 532 passes and 55 skips; focused checks had 27 passes. Independent review approved the implementation. All six files in the setup manifest still match their SHA-256 checksums. Tests were not rerun for this status check.

Actually run: the local n=2 smoke used all 128 rows and two row epochs, totaling 256 nominal row accesses per method. Quiroga completed two updates and FRAMES eight updates. Both completed without a recorded failure. Neither passed the recovery gate at this tiny budget; this run only validates execution and recording.

Penalty policy: Quiroga independently tunes a fixed TP penalty. FRAMES independently tunes its initial TP penalty and increases it with exponent 0.25. In the smoke, Quiroga held alpha_Q=0.05 and lambda_Q=6.4 fixed; FRAMES increased alpha_F from 0.005 to 0.008409 (beta: 100 to 59.4604).

Ruche: the user queue was empty at inspection. Accounting since 4 October contained no new QPT/Quiroga jobs. Independent n=2 calibration, frozen selection and held-out evaluation remain unstarted.

Next step: stage the pinned source on Ruche and run the prepared 20-minute CPU smoke. Then calibrate the methods independently on n=2 full and subset cases, freeze both selected configurations, and evaluate on held-out instances. The n=4 comparison follows those checks.

The previous turn stopped after local preparation. Its Git push was rejected by automatic approval review as code egress without explicit destination approval. This status check performed no publication, transfer or submission.

Evidence: local Git state; live origin branch; Ruche queue, accounting and path checks; plan.json, manifest.sha256 and local_smoke/pair.json in the corrected setup bundle.
