QPT · CURRENT STATUS

No new QPT results since 8 October

Checked 11 October 2026, approximately 19:13 Europe/Paris

Operational status

Live Ruche checks found no running or pending QPT jobs. Scheduler accounting since 8 October shows only the already archived QPT tuning batches from that day. Other running/queued jobs belong to the GW project. No new QPT submission, cancellation, optimization or source edit was made for this status check.

Best verified current result

The selected fixed-penalty FGD configuration with our modified exact factor-ray line search passes all three gates on 16 distinct two-qubit channels: fidelity ≥0.99, full-design RMSE $\leq 10^{-6}$, and normalized TP residual ≤0.001. Worst RMSE is 1.61×10^{-10}; worst normalized TP is 7.80×10^{-10}. These are noiseless rank-one tests, including historical revalidation—not an unseen-test claim.

What remains unresolved

The printed Quiroga adaptive ratio passed 0/44 new tuning trials: 14 completed outside the gate and 30 retained numerical failures. That does not disprove the published results. Prior paired FRAMES diagnostics pass 1/2 channels; the other misses only the RMSE threshold. Independently tuned, best-for-best FRAMES versus published adaFGD is unfinished.

Older work and available deliverables

The local-Pauli results remain a separate benchmark: eight-qubit fidelity about 98.92–99.22% across sampling streams on one target, and ten-qubit 99.00% with 32× lower observation noise. TP remains approximate. The coauthor briefing, legacy addendum, loss plots and author-question checklist are complete and unchanged.

Next scientific step

Request one runnable two-qubit example from Quiroga/Kyrillidis, especially the actual adaptive step, TP weight, POVM constants and initialization conventions. In parallel, independently calibrate the FRAMES initial penalty and increasing-penalty schedule. Freeze settings before final held-out evaluation, then extend the matched comparison to more qubits. No author email has been sent by this assistant.

Code: local checkout is clean at 4ce1108 and six commits ahead of its cached origin branch. The completion record says merged locally, not pushed; the live Git remote was not checked today.

Evidence checked

Live Ruche squeue / sacct; completion_manifest.json; three tuning audits; prior paired audit; local Git status and bounded QPT artifact inventory. Detailed reports remain beside this PDF.
